

## Introductory note

### *DyStar Product Selection 01/2018 to meet the requirements of H&M® Chemical Restrictions (CR) Version January 2018, Apparel, Accessories, Footwear and Home Interior Textile Products*

The H&M® CR Version January 2018 contains a list of substances that are prohibited or restricted for use in textile apparel, accessories, footwear and home interior products supplied to H&M.

DyStar has assessed its global product range for textile coloration and finishing against the a.m. H&M® CR and this document indicates the suitability of each product.

Recommendations are based on our experience with well-established test methods and on dye application tests performed under standard lab conditions. It may be that these are not always representative of the conditions used by our customers. The assessment and recommendations given in the following tables therefore do not absolve the user from making their own tests and controls to ensure that the finished textile article conforms to the H&M® CR requirements.

- Green      Suitable without limitation according to H&M® CR
- » Amber      Suitable with certain limitations indicated by footnotes in the tables
- ✗ Red      NOT suitable

As the world's leading manufacturer of textiles dyes and auxiliaries, DyStar shares H&M's concern for the health of its customers as well as for the environment and working conditions.

The use of high quality products from DyStar and the technical expertise of DyStar personnel offer customers the best assurance of meeting the high standards of the H&M® CR textile requirements.

The tables show all global core products for coloration and finishing of textiles on the DyStar product range which we recommend for H&M® CR (status: January 2018). The confirmation also is valid with the H&M Manufacturing Restricted Substances List (MRSL) of January 2018. None of the substances listed in this MRSL are intentionally added to our formulations or generated during production (please find remark on Ni- and Co-complexes below).

In case of missing items or uncertainties do not hesitate to contact your sales representative.

With best regards,

Dr. Anette Weber

## Introductory remarks

In the case of a metal complex dyes there are different restrictions depending on the nature of the fiber.

**1. Chromium complex dyes can be used for the dyeing of polyamide and polyamide blends (min. 5% PA) as long as the extractable chromium content of the dyed fabric does not exceed 1 mg/kg.**

The H&M® CR requirement for extractable chromium is applicable to all its textiles. DyStar has assessed or tested all its products. The results form the basis of our indication of suitability of these dyes in the product assessment tables. Most DyStar Supralan®, Isolan®, Lava Dye Antique and Diamond dyes may be used without limitation for the dyeing of polyamide and polyamide blends (min. 5% PA).

However for certain products the 1 mg/kg limit for extractable heavy metal may not be achievable in medium-deep shades. This is indicated in the assessment tables by a footnote.

It should be noted though that our standardized lab dyeing and finishing conditions may not always reflect the dyeing and finishing processes in our customers' plants. Our assessments therefore only give an indication and guidance for the pre-selection of H&M® suitable dyestuffs, but must not be regarded as a general suitability guarantee. It is the responsibility of our customers to make their own controls and tests to ensure that the finished textiles meet the H&M® limits for extractable heavy metals. This is especially important for deep shades on polyamide and polyamide blends (due to overloading effects) and for elastane-containing fiber blends.

**2. The total chromium content of textiles (except those which are made from polyamide and polyamide blends (min. 5% PA)) must not exceed 100 mg chromium/kg of finished textile.**

This means in practice that chrome complex dyes cannot be used for the dyeing of wool, cellulose fibers or silk, because the 100 mg/kg limit would be exceeded at very low dyestuff concentrations. As DyStar chrome complex dyes are normally not recommended for the dyeing of cellulose, this is not a significant restriction. But it does mean that our **Supralan® and Isolan®** dyes, which are chromium complex dyes, and also the **Diamond dyes**, cannot be used for the dyeing of standard wool and silk.

**3. Cobalt and nickel complex dyes may currently only be used for the printing and dyeing of textiles, so long as the extractable nickel and cobalt content of the dyed/printed fabric does not exceed 1 mg/kg.**

A few cobalt and nickel complex dyes which we would normally recommend for cellulose fibers should not be used for the dyeing of articles for H&M® as the 1 mg/kg limit for extractable metal may not be achievable unless they are applied in very pale shades or used as shading components.

*It has to be noted that H&M® has listed Cobalt and Cobalt compounds as well as Ni and Ni compounds as group 2 restricted substances within their MRSL. Acceptance of respective metal complex dyes should be reconfirmed with H&M® prior to application of respective dye preparations.*

**4. There is an extractable limit for copper (Cu) of 25 mg/kg for products for children aged 0-3 years in the H&M® chemical restrictions (Version January 2017).**

This means that there are some restrictions on the use of copper complex dyes. Please refer to the information in the product assessment tables.

## Overview of DyStar product ranges

### Textile Colorants

#### For cellulosic fibers

- Reactive dyes
- Direct dyes
- Vat dyes
- Dyes for Denim
- Azoic / developing dyes

Levafix®, Procion®, Remazol® and Lava Dye  
Sirius®  
Indanthren® Colloisol and liquid  
DyStar Indigo, Cassulfon®  
Fast dyes, Naphtol AS®, Phtalogen®

#### For polyester fibers

- Disperse dyes

Dianix®

#### For wool

- After chromed dyes
- Acid metal complex dyes
- Reactive dyes
- Acid dyes

Diamond®  
Isolan®  
Realan®  
Supralan® and Telon®

#### For polyamide

- Acid metal complex dyes
- Acid dyes
- Acid/MC dyes for fashion garment

Isolan®  
Telon®  
Lava Dye Antique

#### For acrylic fibers

- Basic dyes

Astrazon®

#### For textile printing

- Pigment preparations
- Inks for digital printing
- Printing inks (liquid)
- Powder ink concentrates

Imperon®  
Colaris®  
Jettex® A, Jettex® D and Jettex® R  
Jettex® highly purified dyes: Jettex® A and Jettex® R

### Auxiliaries

- Pretreatment & Dyeing & Printing Auxiliaries
- Finishing Auxiliaries
- Laundry Auxiliaries

Sera®  
Evo®  
Lava®

DyStar products as per your *eliot* selection from **19.03.2018**

DyStar products as per your *eliot* selection from **19.03.2018**

**Footnotes, Postive List - H&M®**  
**Chemical Restrictions, Version of January 2018 Apparel /**

<b>E1</b>	Upon application of this product in combination with other pigment preparations kindly refer to special remarks in the product specific technical documentation.
<b>F1</b>	Product complies with the European azo legislation, but can cause false-positive amine results, if the analysis is performed by a GC-MS detection method only. Positive amine results must therefore always be confirmed by a HPLC/DAD detection method (after clean-up with a diatomaceous earth column).
<b>F2</b>	Can cause false positive amine detection (Tobias acid dyestuff).
<b>HM 1</b>	Medium to deep shades should be tested for extractable heavy metals.
<b>HM 1R</b>	To meet H&M requirements for extractable heavy metals an appropriate aftertreatment is recommended. Intensive rinsing/soaping processes with addition of an appropriate sequestering agent (e.g. Sera® Sperse C-SN) are advised. Compliance with extractable heavy metal limits should be tested on medium to deep shades.
<b>HM 10</b>	Recommended, provided a dyestuff concentration of 5.0 % (owf) is not exceeded.
<b>HM 11</b>	Recommended, provided a dyestuff concentration of 2.0 % (owf) is not exceeded.
<b>HM 14</b>	Product is suitable for H&M compliant textiles in standard printing processes. But, the H&M limit of 20 mg/kg cleavable amine could be exceeded, if improper or unusual application conditions are applied (e.g. fixation time; poor binder quality in garment dyeing; discharge printing etc.). It is recommended to test a representative textile strike-off made with the corresponding printing paste for compliance with the azo requirement.
<b>HM 17</b>	Recommended, provided a concentration of 15 g/kg is not exceeded.
<b>HM 19</b>	This pigment preparation is based on Carbon Black (Pigment Black 6 resp. Black 7). As polycyclic aromatic hydrocarbons (PAHs) are created by incomplete combustion of organic material we cannot exclude respective trace impurities. Although usual limit values for PAHs are expected to be met under proper use conditions, they might be exceeded on textiles under improper or special application conditions (e.g. low fixation time, poor binder quality, very deep shade, etc.).

<b>HM 20</b>	Only allowed for polyamide and polyamide blends ( > 5 % polyamide)
<b>HM 40</b>	Only for products for adults without direct skin contact and soft interior products excl. carpets and mats.
<b>HM 41</b>	Flame retardant finishes are not allowed on products for children < 14 years. Use of flame retardant products always requires approval by H&M Global Product Compliance department.
<b>HM 42</b>	All scented children's products (<14 years) must go through H&M risk assessment. The product fulfils IFRA standard. If used in the concentrations recommended in the DyStar Product Information Sheet the limit for fragrance allergens on fabric can be met.
<b>HM 6</b>	Recommended, provided a dyestuff concentration of 4.0 % (owf) is not exceeded.
<b>HM 7</b>	Contains traces of residual chlorinated solvent (chlorinated carrier). Although the H&M limit of 2 mg/kg can normally be met under proper use conditions, the limit may be exceeded on textiles printed under improper or special conditions (e.g. low fixation time; poor binder quality in garment dyeing, very deep shade, etc.). If in doubt, a strike-off should be tested in advance to confirm full compliance.
<b>HM 9</b>	Recommended, provided a dyestuff concentration of 1.0 % (owf) is not exceeded.
<b>HMR 1</b>	Suitable to at least 1/2 standard depth. Darker shades probably need a cationic after treatment to improve the wet fastness properties and to meet the limits for extractable heavy metals.
<b>HMR 2</b>	Diamond dyes do not contain heavy metals but they are applied using a chrome (VI) salt which is chemically converted into chrome (III) during the dyeing process. Textiles dyed with Diamond dyes will nevertheless meet the H&M requirements for extractable chromium providing dyeing is performed strictly according to DyStar's recommendations. This may not hold true with shrink-resist treated wool or for products marked with footnote *(HM 1) in very deep shades. Compliance with extractable chromium limits must be tested in such cases.
<b>HMR 3</b>	Elastane containing fabrics dyed with Isolan dyes may not meet the limits for extractable chromium or cobalt. Representative samples of such fabrics should be generally tested for compliance. It is furthermore recommended to test Isolan dyed textiles for extractable chromium and/or cobalt, if the shade is very deep or the dyeing/rinsing conditions deviate from optimum standard processes.
<b>HMR 4</b>	Elastane containing fabrics dyed with Supralan dyes may not meet the limits for extractable chromium or cobalt. Representative samples of such fabrics should be generally tested for compliance. It is furthermore recommended to test Supralan dyed textiles for extractable chromium and/or cobalt, if the shade is very deep or the dyeing/rinsing conditions deviate from optimum standard processes.
<b>HMR 5</b>	We generally recommend an after treatment of Isolan dyeings on polyamide for the improvement of the wet fastness properties. This may also help to meet the very low limits for extractable cobalt and chromium content. Elastane containing fabrics dyed with Isolan dyes may not meet the limits for extractable chromium or cobalt. Representative samples of such fabrics should be generally tested for compliance. It is furthermore recommended to test Isolan dyed textile for extractable chromium or cobalt, if the shade is very deep or the dyeing/rinsing conditions deviate from optimum standard processes.

#### HMR 6

We generally recommend an after treatment of Lava Dye Antique dyeings on polyamide for the improvement of the wet fastness properties. This may also help to meet the very low limits for extractable cobalt and chromium content. Elastane containing fabrics dyed with Lava Dye Antique dyes may not meet the limits for extractable chromium or cobalt. Representative samples of such fabrics should be generally tested for compliance. It is furthermore recommended to test Lava Dye Antique dyed textile for extractable chromium or cobalt, if the shade is very deep or the dyeing/rinsing conditions deviate from optimum standard processes.
